- 8. (cancelled)
- A system for loading or unloading a container or other structure from a 9. (new) transport vehicle comprising, in combination,
- an elongated body removably attached to a transport vehicle, where the elongated (a) body comprises a track and has a length that is defined by a front end located adjacent to a transport vehicle cab and a rear end located opposite the front;
- a multi-stage central hydraulic cylinder having a fixed end and a moving end, (b) where the fixed end is attached to the rear end of the elongated body and the moving end is attached to a carriage such that extending and retracting the central hydraulic cylinder moves the carriage from the rear of the elongated body to the front of the elongated body, where the carriage is slidably attached to the track of the elongated body and is adapted to travel from the

rear end to the front end of the elongated body during loading of a container onto the transport

vehicle and where the carriage has a combination of,

a first engaging mechanism comprising the jib and hook connected to a first pair of

hydraulic cylinders configured to raise and lower the job and hook about a pivot point, and

a second engaging mechanism comprising a cable sheave and cable combination, where

the first and second engaging mechanisms are adapted to releasably engage a container or other

structure and are connected to and move with the carriage along the entire length of the

elongated body when the central hydraulic cylinder is extended or retracted, where extension of

the central cylinder moves the carriage to the front end of the elongated body and necessarily

causes the container or other structure attached to one of the first or second engaging mechanism

to be loaded onto the elongated body; and

a second pair of hydraulic cylinders connected to the transport vehicle and to the c.

elongated body and oriented such that when the pair of cylinders are extended the front end of

elongated body is lifted to a position above the rear end of the elongated body.

The system of claim 9 where the cable slidably engages the cable sheave 10. (new)

and has a fix end and a free end, where a fixed end is attached to the elongated body and the free

end is configured to releasably engage the container or structure.
